

COMP2310/COMP6310

Systems, Networks, & Concurrency

Convener: Prof John Taylor

The development of C

- **Combined Programming Language (CPL)** was developed in the early 1960s at the University of Cambridge.
- CPL was a high-level language with a very complex and large structure Including data types.
- Its complexity made it difficult to learn and implement, which led to a simplified version called **Basic Combined Programming Language (BCPL)**, developed by Martin Richards in 1967.
- BCPL was designed for writing compilers and operating systems. A key innovation of BCPL was that it introduced the **concept of a "typeless" language** where all data was treated as a word, which was a machine-dependent unit of memory.

The development of C

- BCPL heavily influenced the creation of the **B language** by Ken Thompson in 1969. B was developed for the first version of the Unix operating system on the DEC PDP-7 computer.
- It was essentially a simplified version of BCPL, stripped of more features to make it easier to use on the smaller machines of the time.
- Like BCPL, **B was also a typeless language**, with everything being treated as a machine word. This made it concise but also required that the programmer keep track of the different data types making it error prone and hard to debug.
- B relied heavily on `goto` for control flow

The development of C

- **C developed in 1972 by Dennis Ritchie** at Bell Labs based on the B language
- Introduced data types, structures, and type checking, making it more powerful and flexible than B.
- Introduced **explicit pointer types** (`int *p`, `char *s`, etc.)
- **C Language** formalized control structures like **if**, **while**, and **for**, making them standard in procedural programming and influencing countless languages that followed.
- **C Language** also introduced structures and unions, which allowed for the creation of complex data types
- Used to rewrite the Unix operating system, which helped popularize it.

C and Rust

- two powerful system programming languages
- **C trusts the programmer** — full control but limited protection.
- Mature, vast legacy codebase.
- Extremely fast and low-level
- Use cases: OS kernels, embedded systems, compilers
- **Rust** has had a stable release since 2015
- **Rust protects the programmer** — enforcing memory and concurrency safety without sacrificing performance
- Community growing rapidly with modern libraries
- Use cases: WebAssembly, embedded systems, secure apps

Machine-Level Programming V: Advanced Topics

 - Vulnerability
 - Protection
- **Unions**

x86-64 Linux Memory Layout

not drawn to scale

00007FFFFFFFFFFFFFFF

■ Stack

- Runtime stack (8MB limit)
- E. g., local variables

■ Heap

- Dynamically allocated as needed
- When calling `malloc()`, `calloc()`, `new()`

■ Data

- Statically allocated data
- E.g., global vars, `static` vars, string constants

■ Text / Shared Libraries

- Executable machine instructions
- Read-only

Hex Address

400000
000000

Memory Allocation Example

not drawn to scale

```
char big_array[1L<<24]; /* 16 MB */
char huge_array[1L<<31]; /* 2 GB */

int global = 0;

int useless() { return 0; }

int main ()
{
    void *p1, *p2, *p3, *p4;
    int local = 0;
    p1 = malloc(1L << 28); /* 256 MB */
    p2 = malloc(1L << 8); /* 256 B */
    p3 = malloc(1L << 32); /* 4 GB */
    p4 = malloc(1L << 8); /* 256 B */
    /* Some print statements ... */
}
```

Where does everything go?

x86-64 Example Addresses

address range $\sim 2^{47}$

```
local
p1
p3
p4
p2
big_array
huge_array
main()
useless()
```

```
0x00007ffe4d3be87c
0x00007f7262a1e010
0x00007f7162a1d010
0x000000008359d120
0x000000008359d010
0x0000000080601060
0x0000000000601060
0x000000000040060c
0x0000000000400590
```

Today

- Memory Layout
- **Buffer Overflow**
 - Vulnerability
 - Protection
- Unions

Memory Referencing Bug Example

```
typedef struct {  
    int a[2];  
    double d;  
} struct_t;  
  
double fun(int i) {  
    volatile struct_t s;  
    s.d = 3.14;  
    s.a[i] = 1073741824; /* Possibly out of bounds */  
    return s.d;  
}
```

fun(0)	→	3.14
fun(1)	→	3.14
fun(2)	→	3.1399998664856
fun(3)	→	2.00000061035156
fun(4)	→	3.14
fun(6)	→	Segmentation fault

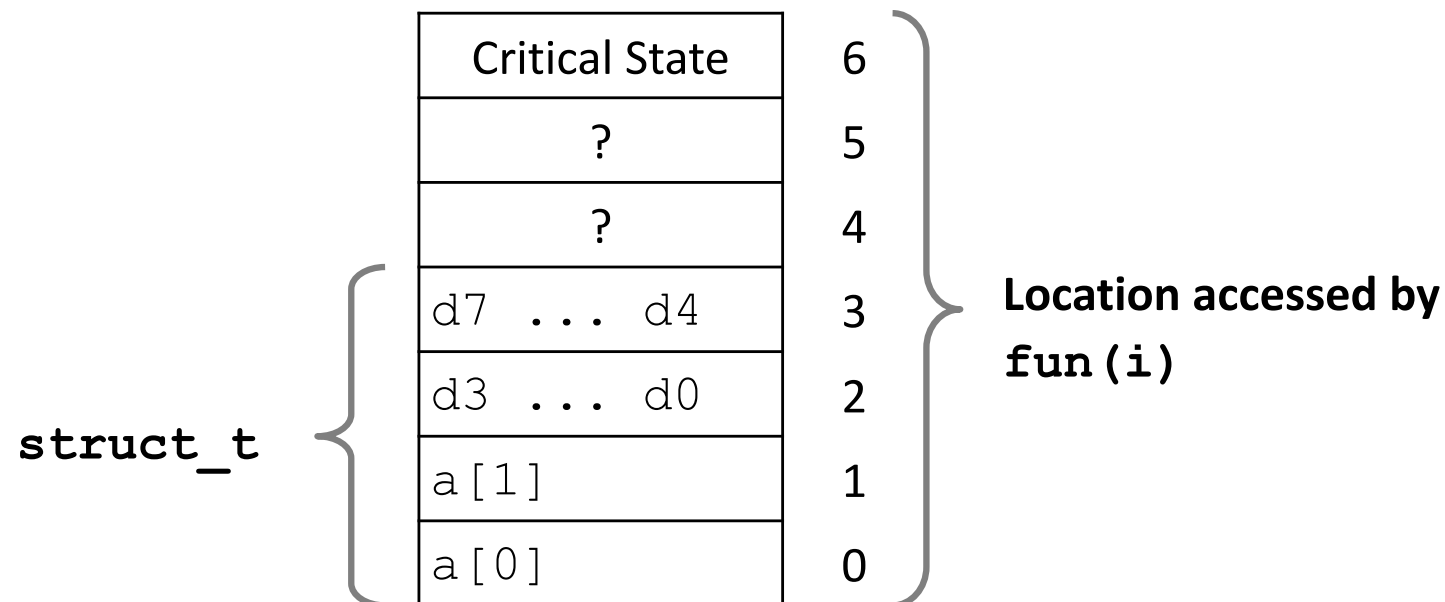

- Result is system specific

Memory Referencing Bug Example

```
typedef struct {  
    int a[2];  
    double d;  
} struct_t;
```

<code>fun(0)</code>	\rightarrow	3.14
<code>fun(1)</code>	\rightarrow	3.14
<code>fun(2)</code>	\rightarrow	3.1399998664856
<code>fun(3)</code>	\rightarrow	2.00000061035156
<code>fun(4)</code>	\rightarrow	3.14
<code>fun(6)</code>	\rightarrow	Segmentation fault

Explanation:

Such problems are a BIG deal

- **Generally called a “buffer overflow”**
 - when exceeding the memory size allocated for an array
- **Why a big deal?**
 - It's the #1 technical cause of security vulnerabilities
 - #1 overall cause is social engineering / user ignorance
- **Most common form**
 - Unchecked lengths on string inputs
 - Particularly for bounded character arrays on the stack
 - sometimes referred to as stack smashing

String Library Code

■ Implementation of Unix function `gets()`

```
/* Get string from stdin */
char *gets(char *dest)
{
    int c = getchar();
    char *p = dest;
    while (c != EOF && c != '\n') {
        *p++ = c;
        c = getchar();
    }
    *p = '\0';
    return dest;
}
```

- No way to specify limit on number of characters to read

■ Similar problems with other library functions

- **`strcpy`, `strcat`**: Copy strings of arbitrary length
- **`scanf`, `fscanf`, `sscanf`**, when given `%s` conversion specification

Vulnerable Buffer Code

```
/* Echo Line */  
void echo()  
{  
    char buf[4]; /* Way too small! */  
    gets(buf);  
    puts(buf);  
}
```

```
void call_echo() {  
    echo();  
}
```

← btw, how big
is big enough?

```
unix>./bufdemo-nsp  
Type a string:012345678901234567890123  
012345678901234567890123
```

```
unix>./bufdemo-nsp  
Type a string:0123456789012345678901234  
Segmentation Fault
```

Buffer Overflow Disassembly

echo:

00000000004006cf <echo>:

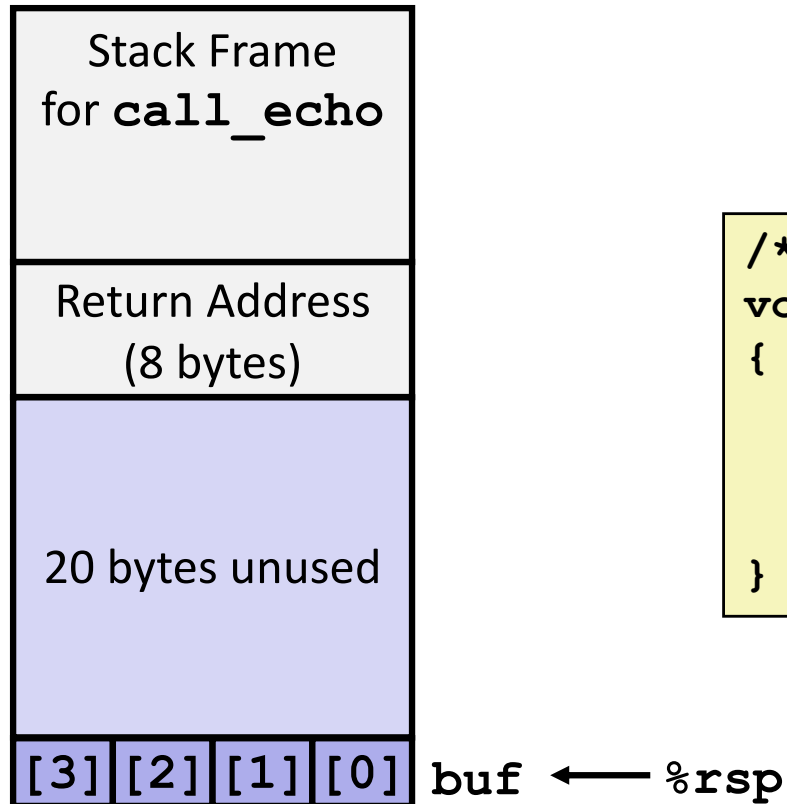

4006cf:	48 83 ec 18	sub	\$0x18 , %rsp
4006d3:	48 89 e7	mov	%rsp , %rdi
4006d6:	e8 a5 ff ff ff	callq	400680 <gets>
4006db:	48 89 e7	mov	%rsp, %rdi
4006de:	e8 3d fe ff ff	callq	400520 <puts@plt>
4006e3:	48 83 c4 18	add	\$0x18, %rsp
4006e7:	c3	retq	

call_echo:

4006e8:	48 83 ec 08	sub	\$0x8, %rsp
4006ec:	b8 00 00 00 00	mov	\$0x0, %eax
4006f1:	e8 d9 ff ff ff	callq	4006cf <echo>
4006f6:	48 83 c4 08	add	\$0x8 , %rsp
4006fa:	c3	retq	

Buffer Overflow Stack

Before call to gets

```
/* Echo Line */  
void echo()  
{  
    char buf[4]; /* Way too small! */  
    gets(buf);  
    puts(buf);  
}
```

```
echo:  
    subq    $24, %rsp  
    movq    %rsp, %rdi  
    call    gets  
    . . .
```

Buffer Overflow Stack Example

Before call to gets

```
void echo()  
{  
    char buf[4];  
    gets(buf);  
    . . .  
}
```

```
echo:  
    subq    $24, %rsp  
    movq    %rsp, %rdi  
    call    gets  
    . . .
```

call_echo:

```
. . .  
4006f1:    callq   4006cf <echo>  
4006f6:    add     $0x8,%rsp  
. . .
```

Buffer Overflow Stack Example #1

After call to gets

. . .  
4006f1:    callq   4006cf <echo>  
4006f6:    add     $0x8,%rsp  
. . .
```

buf ← %rsp

```
unix> ./bufdemo-nsp  
Type a string: 0123456789012345678901234  
Segmentation Fault
```

Overflowed buffer and corrupted return pointer

Buffer Overflow Stack Example #3

After call to gets

Stack Frame for <code>call_echo</code>			
00	00	00	00
00	40	06	00
33	32	31	30
39	38	37	36
35	34	33	32
31	30	29	28
27	26	25	24
23	22	21	20

```
void echo()  
{  
    char buf[4];  
    gets(buf);  
    . . .  
}
```

```
echo:  
    subq    $24, %rsp  
    movq    %rsp, %rdi  
    call    gets  
    . . .
```

call_echo:

```
. . .  
4006f1:    callq   4006cf <echo>  
4006f6:    add     $0x8,%rsp  
. . .
```

buf ← %rsp

```
unix> ./bufdemo-nsp  
Type a string: 012345678901234567890123  
012345678901234567890123
```

Overflowed buffer, corrupted return pointer, but program seems to work!

Buffer Overflow Stack Example #3 Explained

After call to gets

Stack Frame for <code>call_echo</code>			
00	00	00	00
00	40	06	00
33	32	31	30
39	38	37	36
35	34	33	32
31	30	39	38
37	36	35	34
33	32	31	30

`buf` ← `%rsp`

register_tm_clones:

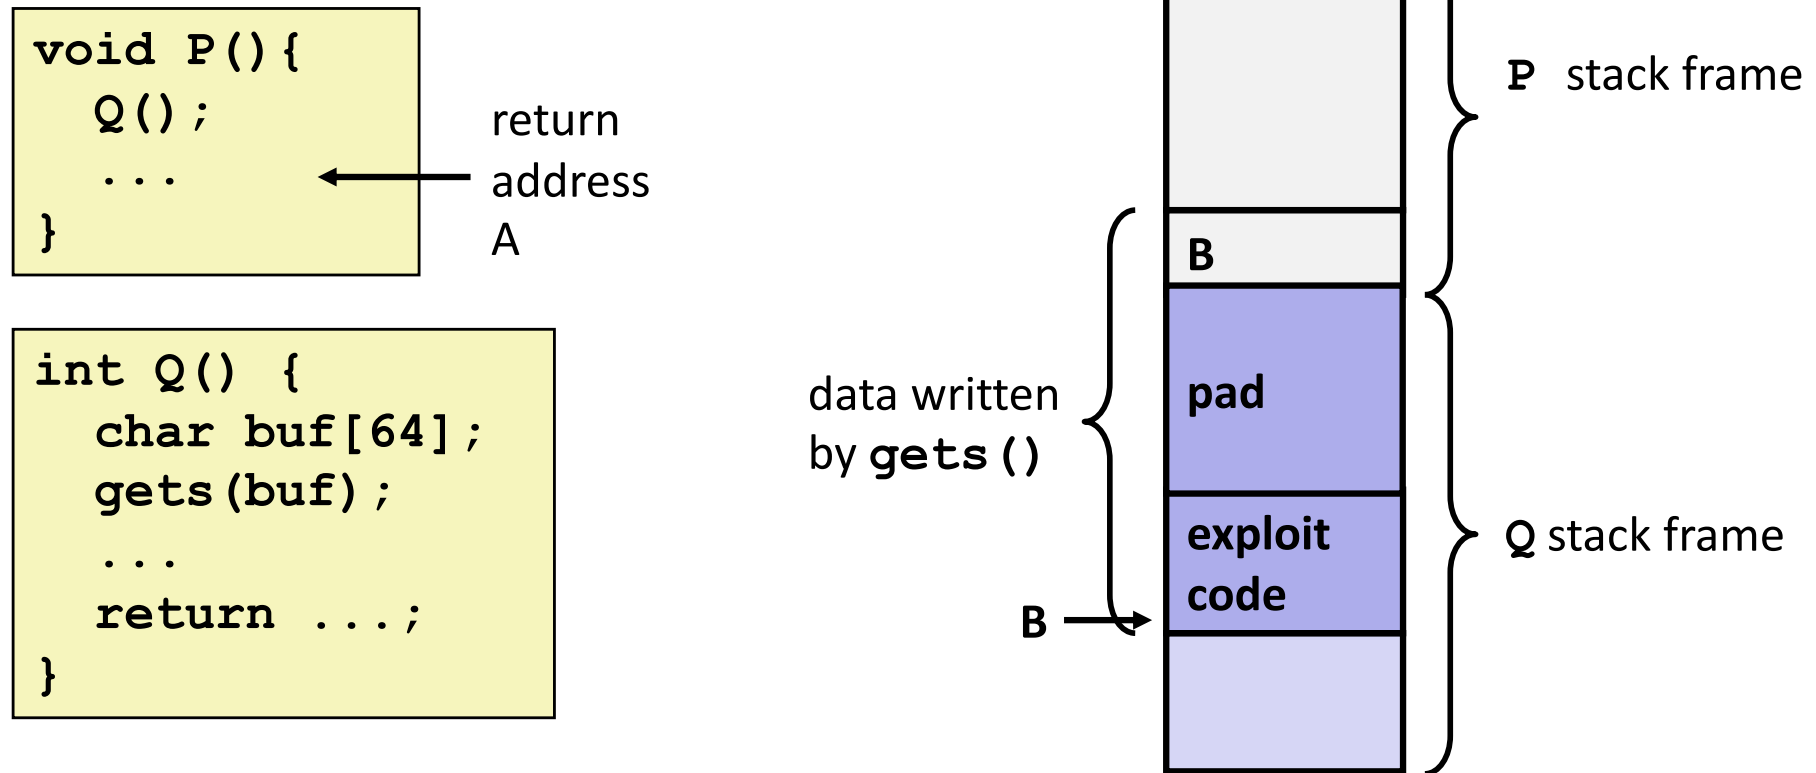

```
. . .  
400600:  mov    %rsp,%rbp  
400603:  mov    %rax,%rdx  
400606:  shr    $0x3f,%rdx  
40060a:  add    %rdx,%rax  
40060d:  sar    %rax  
400610:  jne    400614  
400612:  pop    %rbp  
400613:  retq
```

“Returns” to unrelated code...

Lots of things happen, without modifying critical state

Eventually executes `retq` back to `main`

Code Injection Attacks

- Input string contains byte representation of executable code
- Overwrite return address A with address of buffer B
- When `Q` executes `ret`, will jump to exploit code

Exploits Based on Buffer Overflows

- *Buffer overflow bugs can allow remote machines to execute arbitrary code on victim machines*
- **Distressingly common in real programs**
 - Programmers keep making the same mistakes ☹️
 - Recent measures make these attacks much more difficult

Aside: Worms and Viruses

- **Worm: A program that**
 - Can run by itself
 - Can propagate a fully working version of itself to other computers

- **Virus: Code that**
 - Adds itself to other programs
 - Does not run independently

- **Both are (usually) designed to spread among computers and to wreak havoc**

OK, what to do about buffer overflow attacks...

- Avoid overflow vulnerabilities
 - Employ system-level protections
 - Have compiler use “stack canaries”
- We will examine each of these cases...

1. Avoid Overflow Vulnerabilities in Code (!)

```
/* Echo Line */  
void echo()  
{  
    char buf[4]; /* Way too small! */  
    fgets(buf, 4, stdin);  
    puts(buf);  
}
```

- For example, use library routines that limit string lengths
 - **fgets** instead of **gets**
 - **strncpy** instead of **strcpy**
 - Don't use **scanf** with **%s** conversion specification
 - Use **fgets** to read the string
 - Or use **%ns** where **n** is a suitable integer

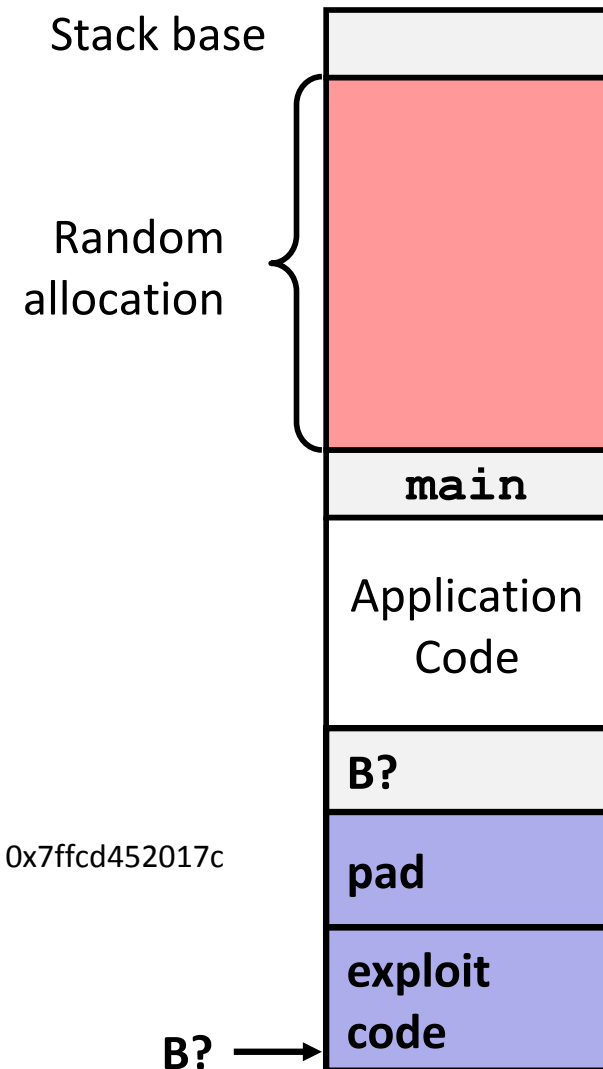

2. System-Level Protections can help

■ Randomized stack offsets

- At start of program, allocate random amount of space on stack
- Shifts stack addresses for entire program
- Makes it difficult for hacker to predict beginning of inserted code
- E.g.: 5 executions of memory allocation code

local 0x7ffe4d3be87c 0x7fff75a4f9fc 0x7ffeadb7c80c 0x7ffeaea2fdac 0x7ffcd452017c

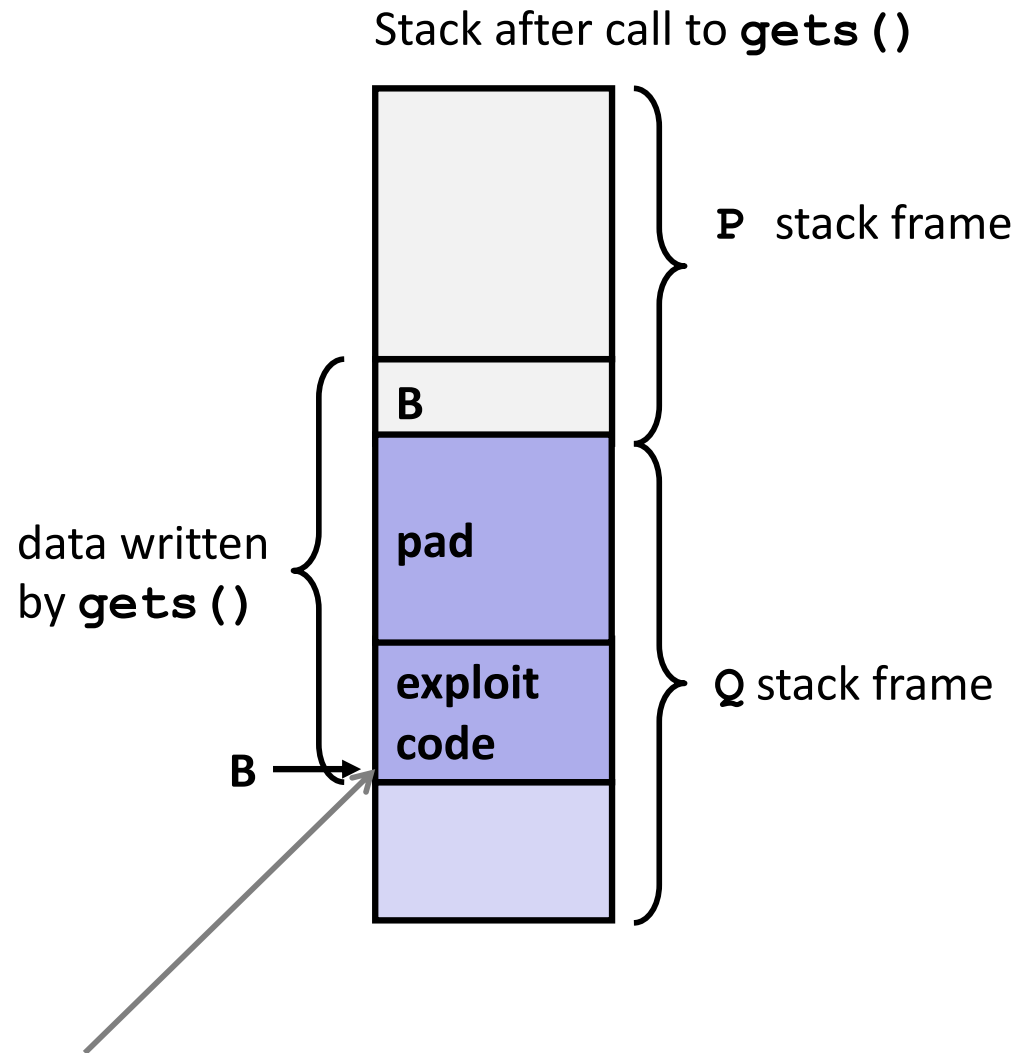

- Stack repositioned each time program executes

2. System-Level Protections can help

■ Nonexecutable code segments

- In traditional x86, can mark region of memory as either “read-only” or “writeable”
 - Can execute anything readable
- X86-64 added explicit “execute” permission
- Stack marked as non-executable

Any attempt to execute this code will fail

3. Stack Canaries can help

■ Idea

- Place special value (“canary”) on stack just beyond buffer
- Check for corruption before exiting function

■ GCC Implementation

- **-fstack-protector**
- Now the default (disabled earlier)

```
unix>./bufdemo-sp  
Type a string:0123456  
0123456
```

```
unix>./bufdemo-sp  
Type a string:01234567  
*** stack smashing detected ***
```

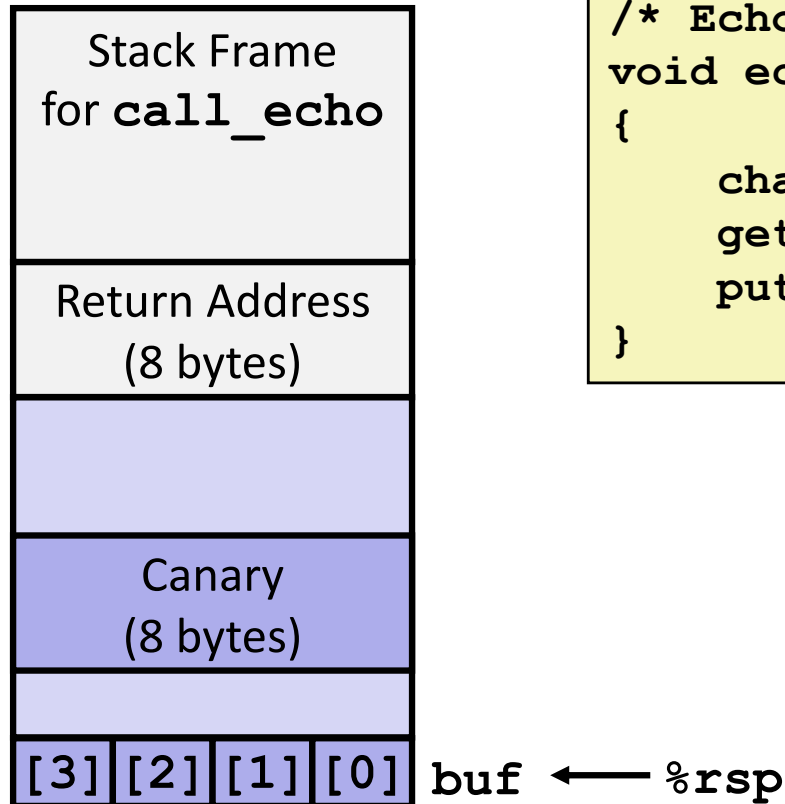

Protected Buffer Disassembly

echo:

```
40072f:  sub    $0x18,%rsp
400733:  mov     %fs:0x28,%rax
40073c:  mov     %rax,0x8(%rsp)
400741:  xor     %eax,%eax
400743:  mov     %rsp,%rdi
400746:  callq   4006e0 <gets>
40074b:  mov     %rsp,%rdi
40074e:  callq   400570 <puts@plt>
400753:  mov     0x8(%rsp),%rax
400758:  xor     %fs:0x28,%rax
400761:  je      400768 <echo+0x39>
400763:  callq   400580 <__stack_chk_fail@plt>
400768:  add     $0x18,%rsp
40076c:  retq
```

Setting Up Canary

Before call to gets

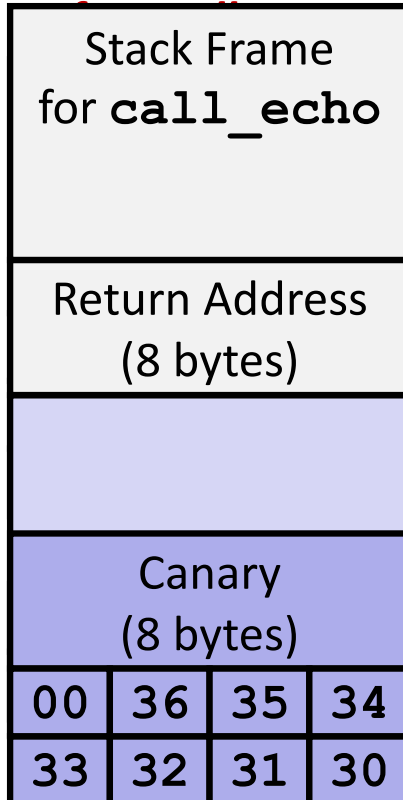

```
/* Echo Line */  
void echo()  
{  
    char buf[4]; /* Way too small! */  
    gets(buf);  
    puts(buf);  
}
```

```
echo:  
    . . .  
    movq    %fs:40, %rax    # Get canary  
    movq    %rax, 8(%rsp)  # Place on stack  
    xorl    %eax, %eax     # Erase canary  
    . . .
```

Checking the Canary

After call to gets

```
/* Echo Line */
void echo()
{
    char buf[4]; /* Way too small! */
    gets(buf);
    puts(buf);
}
```

Input: *0123456*

`buf ← %rsp`

```
echo:
    . . .
    movq    8(%rsp), %rax    # Retrieve from
stack
    xorq    %fs:40, %rax     # Compare to canary
    je      .L6             # If same, OK
    call    __stack_chk_fail # FAIL
```

Return-Oriented Programming Attacks

■ Challenge (for hackers)

- Stack randomization makes it hard to predict buffer location
- Marking stack nonexecutable makes it hard to insert binary code

■ Alternative Strategy

- Use existing code
 - E.g., library code from `stdlib`
- String together fragments to achieve overall desired outcome
- *Does not overcome stack canaries*

■ Construct program from *gadgets*

- Sequence of instructions ending in `ret`
 - Encoded by single byte `0xc3`
- Code positions fixed from run to run
- Code is executable

Gadget Example #1

```
long ab_plus_c  
  (long a, long b, long c)  
{  
    return a*b + c;  
}
```

```
00000000004004d0 <ab_plus_c>:  
4004d0: 48 0f af fe  imul %rsi,%rdi  
4004d4: 48 8d 04 17  lea (%rdi,%rdx,1),%rax  
4004d8: c3           retq
```

$\text{rax} \leftarrow \text{rdi} + \text{rdx}$

Gadget address = 0x4004d4

- Use tail end of existing functions

Gadget Example #2

```
void setval(unsigned *p) {  
    *p = 3347663060u;  
}
```

<setval>:
4004d9: c7 07 d4 **48 89 c7** movl \$0xc78948d4, (%rdi)
4004df: **c3** retq

Encodes `movq %rax, %rdi`

`rdi ← rax`

Gadget address = `0x4004dc`

■ Repurpose byte codes

ROP Execution

- **Trigger with `ret` instruction**
 - Will start executing Gadget 1
- **Final `ret` in each gadget will start next one**

Today

- **Memory Layout**
- **Buffer Overflow**
 - Vulnerability
 - Protection
- **Unions**

Union Allocation

- Allocate according to largest element
- Can only use one field at a time

```
union U1 {  
    char c;  
    int i[2];  
    double v;  
} *up;
```

```
struct S1 {  
    char c;  
    int i[2];  
    double v;  
} *sp;
```

Using Union to Access Bit Patterns

```
typedef union {  
    float f;  
    unsigned u;  
} bit_float_t;
```

```
float bit2float(unsigned u)  
{  
    bit_float_t arg;  
    arg.u = u;  
    return arg.f;  
}
```

Same as `(float) u`?

```
unsigned float2bit(float f)  
{  
    bit_float_t arg;  
    arg.f = f;  
    return arg.u;  
}
```

Same as `(unsigned) f`?

Byte Ordering Revisited

■ Idea

- Short/long/quad words stored in memory as 2/4/8 consecutive bytes
- Which byte is most (least) significant?
- Can cause problems when exchanging binary data between machines

■ Big Endian

- Most significant byte has lowest address
- Sparc

■ Little Endian

- Least significant byte has lowest address
- Intel x86, ARM Android and IOS

■ Bi Endian

- Can be configured either way
- ARM

Byte Ordering Example

```
union {  
    unsigned char c[8];  
    unsigned short s[4];  
    unsigned int i[2];  
    unsigned long l[1];  
} dw;
```

32-bit

c[0]	c[1]	c[2]	c[3]	c[4]	c[5]	c[6]	c[7]
s[0]		s[1]		s[2]		s[3]	
i[0]				i[1]			
l[0]							

64-bit

c[0]	c[1]	c[2]	c[3]	c[4]	c[5]	c[6]	c[7]
s[0]		s[1]		s[2]		s[3]	
i[0]				i[1]			
l[0]							

Byte Ordering Example (Cont).

```
int j;
for (j = 0; j < 8; j++)
    dw.c[j] = 0xf0 + j;

printf("Characters 0-7 ==
[0x%x,0x%x,0x%x,0x%x,0x%x,0x%x,0x%x,0x%x]\n",
    dw.c[0], dw.c[1], dw.c[2], dw.c[3],
    dw.c[4], dw.c[5], dw.c[6], dw.c[7]);

printf("Shorts 0-3 == [0x%x,0x%x,0x%x,0x%x]\n",
    dw.s[0], dw.s[1], dw.s[2], dw.s[3]);

printf("Ints 0-1 == [0x%x,0x%x]\n",
    dw.i[0], dw.i[1]);

printf("Long 0 == [0x%lx]\n",
    dw.l[0]);
```

100

Little Endian

f0	f1	f2	f3	f4	f5	f6	f7
c[0]	c[1]	c[2]	c[3]	c[4]	c[5]	c[6]	c[7]
s[0]		s[1]		s[2]		s[3]	
i[0]				i[1]			
l[0]							

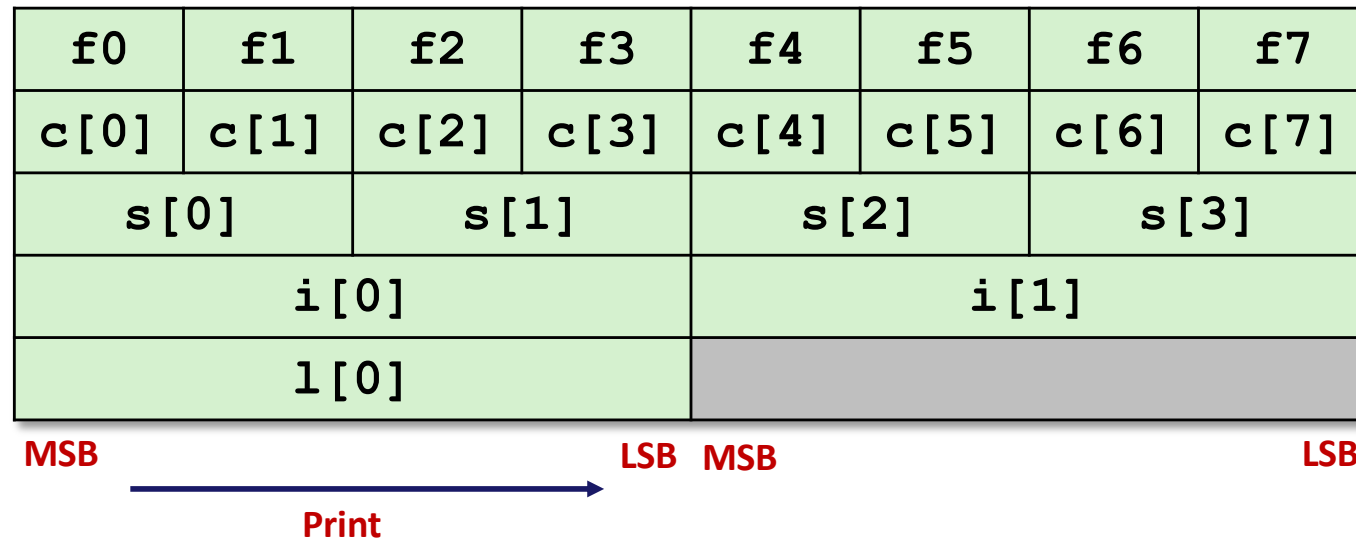

LSB ← Print → MSB LSB MSB

Output:

Characters	0-7	==	[0xf0,0xf1,0xf2,0xf3,0xf4,0xf5,0xf6,0xf7]
Shorts	0-3	==	[0xf1f0,0xf3f2,0xf5f4,0xf7f6]
Ints	0-1	==	[0xf3f2f1f0,0xf7f6f5f4]
Long	0	==	[0xf3f2f1f0]

Byte Ordering on Sun

Big Endian

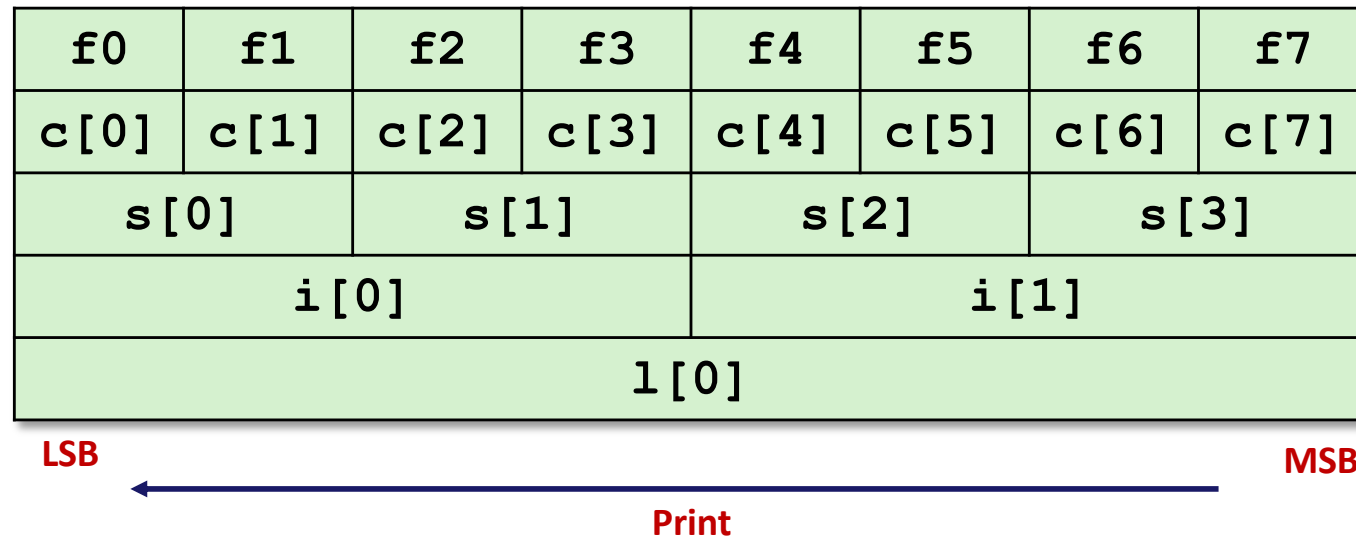

Output on Sun:

Characters 0-7 == [0xf0,0xf1,0xf2,0xf3,0xf4,0xf5,0xf6,0xf7]
Shorts 0-3 == [0xf0f1,0xf2f3,0xf4f5,0xf6f7]
Ints 0-1 == [0xf0f1f2f3,0xf4f5f6f7]
Long 0 == [0xf0f1f2f3]

Byte Ordering on x86-64

Little Endian

Output on x86-64:

Characters 0-7 == [0xf0,0xf1,0xf2,0xf3,0xf4,0xf5,0xf6,0xf7]
Shorts 0-3 == [0xf1f0,0xf3f2,0xf5f4,0xf7f6]
Ints 0-1 == [0xf3f2f1f0,0xf7f6f5f4]
Long 0 == [0xf7f6f5f4f3f2f1f0]

Summary of Compound Types in C

■ Arrays

- Contiguous allocation of memory
- Aligned to satisfy every element's alignment requirement
- Pointer to first element
- No bounds checking

■ Structures

- Allocate bytes in order declared
- Pad in middle and at end to satisfy alignment

■ Unions

- Overlay declarations
- Way to circumvent type system
